

# CS343 - Operating Systems

## Module-1B

### Types of Operating Systems

**Dr. John Jose**

**Assistant Professor**

**Department of Computer Science & Engineering**

**Indian Institute of Technology Guwahati, Assam.**

**<http://www.iitg.ac.in/johnjose/>**

# Session Outline

- ❖ Review of basic operating system concepts
- ❖ Desktop PCs
- ❖ Parallel Systems
- ❖ Multiprogramming Systems
- ❖ Clustered Systems
- ❖ Real-time Systems
- ❖ Embedded Systems

# What is an Operating System?

- ❖ A program that acts as an intermediary between a user of a computer and the computer hardware
- ❖ Operating system goals:
  - ❖ Execute user programs on hardware
  - ❖ Make the computer system convenient to use
  - ❖ Use the computer hardware in an efficient manner

# Computer System Structure

- ❖ Computer system can be divided into four components:
  - ❖ **Hardware** -- CPU, memory, I/O devices
  - ❖ **Operating system** -- Controls and coordinates hardware/software
  - ❖ **Application programs** -- Word processors, compilers, web browsers, database systems, video games, apps
  - ❖ **Users** -- People or devices

# Operating System Definition

- ❖ OS is a **resource allocator**
  - ❖ Manages all resources
  - ❖ Decides between conflicting requests for efficient and fair resource use
- ❖ OS is a **control program**
  - ❖ Controls execution of programs to prevent errors and improper use of the computer
  - ❖ The one program running at all times on the computer RAM is the **kernel of the OS**.

# Types of Operating Systems

- ❖ Most systems use a single general-purpose/special purpose processor
- ❖ There are several architectures which all require a different OS:
  - ❖ Desktop PCs
  - ❖ Parallel Systems
  - ❖ Distributed Systems
  - ❖ Clustered Systems
  - ❖ Real-time Systems
  - ❖ Embedded Systems

# Desktop PCs

- ❖ Personal Computers – computer system dedicated to a single user.
- ❖ I/O devices – keyboards, mice, display screens, small printers.
- ❖ User convenience and responsiveness.
- ❖ Mostly single user - do not need advanced CPU utilization or protection features.
- ❖ May run several different types of operating systems (Windows, MacOS, UNIX, Linux)

# Parallel Systems

- ❖ Multiprocessor systems with more than one CPU in close communication.
- ❖ **Tightly coupled system** – processors share memory and the internal clock; communication usually takes place through the shared memory.
- ❖ **Loosely coupled system** – multiple processors/computers with its own memory connected together for efficiency and throughput.

# Multiprocessor Systems

- ❖ Most systems use a single general-purpose/special purpose processor
- ❖ **Multiprocessors** systems growing in use and importance
  - ❖ **Increased throughput**
  - ❖ **Economy of scale**
  - ❖ **Increased reliability** – graceful degradation or fault tolerance
  - ❖ **Asymmetric Multiprocessing**
  - ❖ **Symmetric Multiprocessing**

# Multiprocessor Systems

## ❖ Asymmetric Multiprocessing

- ❖ Each processor is assigned a specific task; master processor schedules and farms work to slave processors.
- ❖ More common in extremely large systems like mainframes with hundreds of processors.

Symmetric Multiprocessing

Asymmetric Multiprocessing

# Multiprocessor Systems

- ❖ **Symmetric Multiprocessing**
- ❖ Each processor runs an identical copy of the operating system.
- ❖ The OS code is usually shared.
- ❖ Many processes can run at once without performance deterioration.
- ❖ Most modern operating systems have SMP support.
- ❖ OS has to cater for protection of data.

# Multicore Design

- ❖ Multi-chip and multicore is a special case of tightly coupled parallel system.
- ❖ A single chip containing multiple separate systems

# Clustered Systems

- ❖ Like multiprocessor systems working together
  - ❖ Usually sharing storage via a **storage-area network (SAN)**
  - ❖ Provides a **high-availability** service which survives failures
    - ❖ **Asymmetric clustering** has one machine in hot-standby mode
    - ❖ **Symmetric clustering** has multiple nodes running applications, monitoring each other

# Clustered Systems

- ❖ Some clusters are for **high-performance computing (HPC)**
  - ❖ Applications must be written to use **parallelization**
- ❖ Some have **distributed lock manager (DLM)** to avoid conflicting operations

# Multiprogramming Systems

- ❖ **Multiprogramming** (**Batch system**) needed for efficiency
  - ❖ Single user cannot keep CPU and I/O devices busy at all times
  - ❖ Multiprogramming organizes jobs (code and data) so CPU always has one to execute
  - ❖ A subset of total jobs in system is kept in memory
  - ❖ One job selected and run via **job scheduling**
  - ❖ When it has to wait (for I/O), OS switches to another job

# Timesharing Systems

- ❖ **Timesharing** (**multitasking**) is logical extension in which CPU switches jobs so frequently that users can interact with each job while it is running, creating **interactive** computing
  - ❖ **Response time** should be  $< 1$  second
  - ❖ Each user has at least one program executing in memory
  - ❖ If several jobs ready to run at the same time  $\Rightarrow$  **CPU scheduling**
  - ❖ If processes don't fit in memory, **swapping** moves them in and out to run
  - ❖ **Virtual memory** allows execution of processes not completely in memory

# Memory Layout for Multiprogrammed System

# Real-Time Systems

- ❖ Often used as a control device in a dedicated application such as controlling scientific experiments, medical imaging systems, industrial control systems, and some display systems.
- ❖ Well-defined fixed-time constraints.
- ❖ Real-Time systems may have either hard or soft real-time.

# Embedded Systems

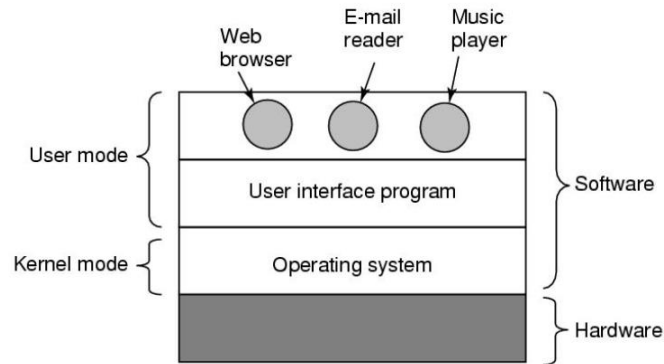

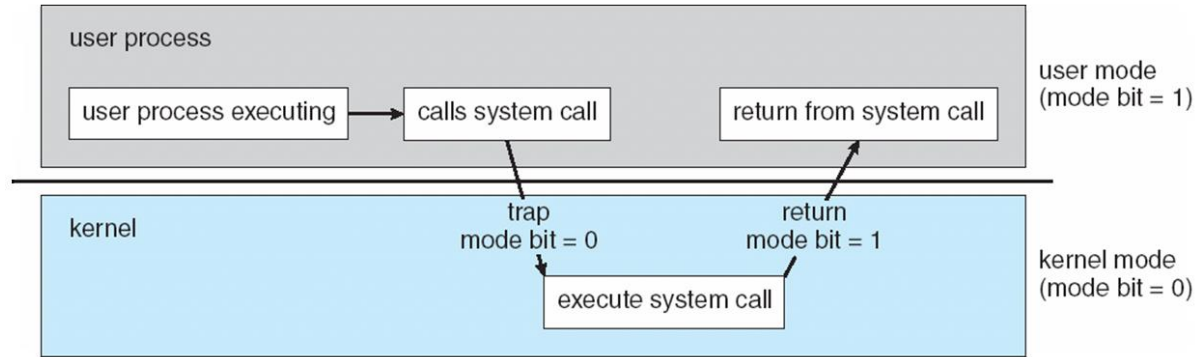

- ❖ Personal Digital Assistants (PDAs)
- ❖ Smart telephones
- ❖ Issues:
  - ❖ Limited memory, Slow processors, Small display screens.
  - ❖ Emphasis is on I/O operations.
  - ❖ Limited memory management and protection

# Operating System in Dual Mode

- ❖ **Dual-mode** operation allows OS to protect itself and other system components
  - ❖ **User mode** and **kernel mode**
  - ❖ **Mode bit** provided by hardware
  - ❖ Provides ability to distinguish when system is running user code or kernel code
  - ❖ Some instructions designated as **privileged**, only executable in kernel mode
  - ❖ System call changes mode to kernel, return from call resets it to user

# Operating System in Dual Mode

*Thank you*
